

Have you had life-long concerns about balance and movement?

IS THIS YOU?

- Did not like slides, swings, or rollercoasters as a child
- Are made anxious by escalators, elevators, and heights as an adult
- Always watch your step

Researchers in the Occupational Therapy Program are seeking adults between **18 and 75 years old** who have had **problems with balance and movement since childhood** to find the reasons for these problems.

Participation involves an in-person visit (about 1 hour) including a series of tests to assess visual perception and memory and questionnaires relating to sensory experiences. Participants will be compensated \$25 for their time.
